SATEL-TR489 TRANSCEIVER MODULE

INTEGRATION GUIDE

Version 1.3

IMPORTANT NOTICE

All rights to this manual are owned solely by SATEL Oy (referred to in this user guide as SATEL). All rights reserved. The copying of this manual (without the written permission from the owner) by printing, copying, recording or by any other means, or the full or partial translation of the manual to any other language, including all programming languages, using any electrical, mechanical, magnetic, optical, manual or other methods or devices is forbidden.

SATEL reserves the right to change the technical specifications or functions of its products, or to discontinue the manufacture of any of its products or to discontinue the support of any of its products, without any written announcement and urges its customers to ensure, that the information at their disposal is valid.

SATEL software and programs are delivered "as is". The manufacturer does not grant any kind of warranty including guarantees on suitability and applicability to a certain application. Under no circumstances is the manufacturer or the developer of a program responsible for any possible damages caused by the use of a program. The names of the programs as well as all copyrights relating to the programs are the sole property of SATEL. Any transfer, licensing to a third party, leasing, renting, transportation, copying, editing, translating, modifying into another programming language or reverse engineering for any intent is forbidden without the written consent of SATEL.

SATEL PRODUCTS HAVE NOT BEEN DESIGNED, INTENDED NOR INSPECTED TO BE USED IN ANY LIFE SUPPORT RELATED DEVICE OR SYSTEM RELATED FUNCTION NOR AS A PART OF ANY OTHER CRITICAL SYSTEM AND ARE GRANTED NO FUNCTIONAL WARRANTY IF THEY ARE USED IN ANY OF THE APPLICATIONS MENTIONED.

Salo, FINLAND 2023

RESTRICTIONS ON USE – SATEL-TR489

SATEL-TR489 radio transceiver module has been designed to operate on 403-473 MHz, 856-876 MHz and 902-928 MHz, the exact use of which differs from one region and/or country to another. The user of a radio transceiver module must take care that the said device is not operated without the permission of the local authorities on frequencies other than those specifically reserved and intended for use without a specific permit.

SATEL-TR489 is allowed to be used in the following countries. More detailed information is available at the local frequency management authority.

Countries: AT, AU, BE, BG, CA, CH, CY, CZ, DE, DK, EE, ES, FI, FR, GB, GR, HU, HR, IE, IS, IT, LT, LU, LV, MT, NL, NO, NZ, PL, PT, RO, SE, SI, SK, TR, US

WARNING – RF Exposure! To comply with RF exposure compliance requirements in Europe, USA and Canada maximum antenna gain on 400 MHz band is 14 dBi and a separation distance of at least 1.1 meter must be maintained between the antenna of this device and all persons.

This radio transmitter 2422A-SATELTA43 has been approved by Innovation, Science and Economic Development (ISED) Canada to operate with the antenna types listed below with the maximum permissible gain indicated. Antenna types not included in this list, having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Antenna type	Manufacturer	Antenna model	Maximum gain (dBi)
Omnidirectional (whip)	Laird Connectivity	FG9026	6
Directional (yagi)	PulseLarsen Antennas	YA6900W	6

NOTE!

According to the requirements of the FCC, the integrator should make sure that the SATEL-TR489 is compliant to part 15B and Part 90 while integrated in the host device. Output power and spurious emissions should be verified.

PRODUCT CONFORMITY

Under the sole responsibility of manufacturer SATEL Oy declares that SATEL-TR489 radio transceiver module is in compliance with the essential requirements (radio performance, electromagnetic compatibility and electrical safety) and other relevant provisions of Directives 2014/53/EU and 2011/65/EU and Council recommendation 1999/519/EC. Therefore, the equipment is labeled with the following CE-marking. The operating frequency range of the device is not harmonized throughout the market area, and the local spectrum authority should be contacted before the usage of the radio module.

CE

For 902-928 MHz

This device complies with ISED license-exempt RSS standard(s) and part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device. Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Le présent appareil est conforme aux CNR d'ISED applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes : (1) l'appareil ne doit pas produire de brouillage, et (2) l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

WARRANTY AND SAFETY INSTRUCTIONS

Read these safety instructions carefully before using the product:

-Warranty will be void, if the product is used in any way that is in contradiction with the instructions given in this manual

-The radio transceiver module is only to be operated at frequencies allocated by local authorities, and without exceeding the given maximum allowed output power ratings. SATEL and its distributors are not responsible, if any products manufactured by it are used in unlawful ways.

-The devices mentioned in this manual are to be used only according to the instructions described in this manual. Faultless and safe operation of the devices can be guaranteed only if the transport, storage, operation and handling of the device are appropriate. This also applies to the maintenance of the products.

HOST INTEGRATION

To ensure compliance with all non-transmitter functions the host manufacturer is responsible for ensuring compliance with the module(s) installed and fully operational. For example, if a host was previously authorized as an unintentional radiator under the Declaration of Conformity procedure without a transmitter certified module and a module is added, the host manufacturer is responsible for ensuring that after the module is installed and operational the host continues to be compliant with the Part 15B unintentional radiator requirements. This module is certified for Fixed and Mobile Applications only, for portable applications you will require a new certification.

This device has been modularly approved. Model name, FCC and Industry Canada identifiers of this product must appear on the outside label of the end-user equipment.

Host labelling example:

Model Name:	SATEL-TR489
Contains	FCC ID: MRBSATEL-TA43
	IC: 2422A-SATELTA43
rules. Operatior two conditions: harmful interfer accept any inter	plies with part 15 of the FCC is subject to the following (1) This device may not cause rence, and (2) this device must ference received, including it may cause undesired

1 INTRODUCTION

SATEL Oy is a Finnish electronics and Telecommunications company specializing in the design and manufacture of wireless data communication products. SATEL designs, manufactures and sells radio modems intended for use in applications ranging from data transfer to alarm relay systems. End users of SATEL products include both public organizations and private individuals.

SATEL Oy is the leading European manufacturer of radio modems. SATEL radio modems have been certified in most European countries and also in many non-European countries.

This document is the integration guide for the SATEL-TR489 radio transceiver module. It is intended to describe how to use these modules and how to integrate those into a host device.

Abbreviation	Description
CTS	Clear To Send, handshaking signal used in asynchronous
	communication.
DTE	Data Terminal Equipment (typically computer, terminal)
ESD	Electrostatic discharge
RD	Receive Data
TD	Transmit Data
RTS	Ready To Send, handshaking signal used in asynchronous
	communication.
RAM	Random Access Memory
LDO	Low dropout regulator
UHF	Ultra High Frequency
RF	Radio Frequency
CPU	Central processing unit

1.1 <u>Terms and abbreviations</u>

1.2 Description of the product

The SATEL-TR489 is UHF radio transceiver module, which transmits and receives data from the UHF frequency band. The module is designed to be as compact and power efficient as possible. They have been developed to be especially suitable for integration into battery powered and space constrained host applications benefiting from UHF communications.

The transceiver module transmits and receives data via the Air interface, modulates and demodulates, encodes and decodes the data and sends the received data payload to the DTE port. The DTE interface is used to provide power and communicate with the module.

2 TECHNICAL SPECIFICATIONS

2.1 <u>Absolute maximum ratings</u>

Absolute maximum ratings for voltages on different pins are listed in the following table. Exceeding these values will cause permanent damage to the module.

Parameter	Min	Мах	
Voltage at VCC_IN	0 V	+6 V	
Voltage at ENA_MOD	0 V	+6 V	
Voltage at VCC_IO	0 V	3.75 V	
Voltage at digital inputs (except ENA_MOD)	0 V	3.75 V	
Voltage at digital outputs	0 V	3.75 V	

Note. All voltages are referenced to GND.

2.2 DC electrical specifications

Recommended operating conditions:

Parameter	Condition	Min	Мах	Units
VCC_IN		+3.8	+5.5	V
ENA_MOD, Vlow		0	0.2	V
ENA_MOD, Vhigh		1.2	VCC_IN	V
VCC_IO		1.8	3.3	V
Logic input, Vlow	1.8 V <vcc_io<3.3v< td=""><td>0</td><td>0.3</td><td>V</td></vcc_io<3.3v<>	0	0.3	V
Logic input, Vhigh	1.8 V <vcc_io<3.3v< td=""><td>0.9*VCC_IO</td><td>VCCIO</td><td>V</td></vcc_io<3.3v<>	0.9*VCC_IO	VCCIO	V
Logic output, Vlow	1.8 V <vcc_io<3.3v< td=""><td>0</td><td>0.5</td><td>V</td></vcc_io<3.3v<>	0	0.5	V
Logic output, Vhigh	1.8 V <vcc_io<3.3v< td=""><td>0.6*VCC_IO</td><td>VCCIO</td><td>V</td></vcc_io<3.3v<>	0.6*VCC_IO	VCCIO	V
Logic output, max current	All logic output except STAT pin.	-	4	mA
Logic output, max current, STAT pin		-	12	mA

2.3 Standard compliance

SATEL-TR489 complies with the following international standards:

- EN 300 113
- EN 300 220-1, -2
- EN 301 489-1, -3
- EN / IEC 62368-1
- FCC Parts 15.209 and 15.247 of Title 47
- IC RSS-247, ICC RSS-Gen

3 TIME PARAMETERS FOR STARTUP AND SHUTDOWN SEQUENCES

The following table shows the recommend times for startup and shutdown sequences.

Parameter	Recom. Time ^{(*}	Explanation
t _{vccin-ena}	>2 ms	VCC_IN must be high before ENA_MOD is high
t _{enamod-io}	>2 ms	ENA_MOD must be high before VCC_IO is high
t _{enamod-cts}	100 ms <t<sub>enamod-cts< 500 ms</t<sub>	CTS ready settling time
t _{vccio-cts}	>2 ms	VCC_IO must be high before CTS is ready
t _{vccio-gpio}	>2 ms	VCC_IO must be high before GPIO PINS are active
t _{gpio-cts}	>0 ms	GPIOS must be active before CTS is ready
t _{enamod-gpio}	>80 ms	Input pins must be low after ENA MOD is low
t _{gpio-vccio}	>0 ms	GPIOs must be low before VCC_IO is low
t _{vccio-vccin}	>0 ms	VCC_IO must be low before VCC is low

3.1 Startup sequence

The following diagram will describe the startup sequence.

Figure 3.1 Startup sequence.

3.2 Shutdown and ENA sequences

The following diagrams will describe the shutdown and ENA sequences.

4 ELECTRICAL INTERCONNECTION

4.1 DTE connector

The DTE connector is a 20-pin pass-through connector. Connector is female two row 1.27 mm pitch. This connector allows the pin to enter the connector from the bottom side and protrude thru the module PCB to the top side, allowing flexible mounting heights with various pin lengths. Alternative DTE connector assembly variants available. DTE connector assembled either BOTTOM or TOP side of the module.

Figure 4.1 The side view of the module with connection directions.

2 1 1 1 1 1 1 1 1 1 1 1 20 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	

Figure 4.2 Pin numbering of 1.27 mm pitch DTE connector. View from bottom side of unit.

4.2 Pin order of the DTE connector

Direction **IN** is data from DTE (Data Terminal Equipment) to the radio transceiver module. Direction **OUT** is data from the radio module to the DTE.

L8	1000 Ω +- 25%	Measured Impedance at 100MHz
R8	1 kΩ	
R9	>1 MΩ	
R10	100 kΩ	

Component values of the equivalent schematics:

4.4 <u>RF interface</u>

The antenna interface is a 50 Ω coaxial connector. Matching networks are not included on the module and should be placed in the host application if the antenna is not 50 Ω . The HIROSE U.FL compatible connector is located on the TOP side of the board.

NOTE! The used connector has gold plated contacts - whereas a standard HIROSE U-FL has silver plated contacts.

If silver - gold joints are not allowed in your product, use gold plated cable-connector to mate to this device.

NOTE!

Setting the transmitter output power to such a level that exceeds the regulations set forth by local authorities is strictly forbidden. The setting and/or using of non-approved power levels may lead to prosecution. SATEL and its distributors are not responsible for any illegal use of its radio equipment and are not responsible in any way of any claims or penalties arising from the operation of its radio equipment in ways contradictory to local regulations and/or requirements and/or laws.

4.5 <u>VCC_IO pin</u>

VCC_IO pin determines the voltage level of UART signals and the voltage level of GPIO output signals. VCC_IO level also determines GPIO LOW/HIGH levels on each GPIO and UART input pins.

4.6 Service pin

The SERVICE pin is used to set the UART1 into a known state. Pulling this pin LOW will activate the service mode and set the UART1 into 38400, 8, N, 1. This is intended for service access of the module, to have a known serial port setting in order to provide easy access to module settings.

The pin does not affect any permanent settings, nor does it change the mode of the module. It is recommended to pull high or pull up by resistor to VCC_IO to return serial port 1 into the configured state. When service pin is LOW the SL Commands are temporary forced to be ON

4.7 <u>Stat pin</u>

The STAT-pin indicates the status of the device. It can be used to drive or sink a LED current using a proper series resistor. STAT-pin drive or sink capability is +/-10mA at 3.3 V. It is recommended to use VCC_IO for LED current.

Notice that if STAT-pin is used to sink LED current, LED behavior is opposite to driving scheme. The behavior of the STAT pin is described down below.

Blink cycle	Mode
"1" - statically	Module is operational "searching for a new frame"
"0" for the endurance of the	"0" when module is receiving data from air interface.
received frame.	In practical cases will toggle at the frequency of the data
	packets on the air interface.
"0" statically	Module is in sleep1 mode
The pin is toggled in transmission	Module is sending data Over the Air
interval	
Pin is toggled in 1 s interval	Module has the connection to SATEL Configuration Manager

	program.
Pin is toggled in 500 ms interval	SL command mode set to OFF and SL commands enabled
	using "+ + +" sequence, section 7.2.
Pin is toggled in 250 ms interval	Module has detected a fault, fault codes can be read via SW
	tools.

4.8 <u>VCC pins</u>

VCC pins are to feed operating voltage to the module. Limit for this voltage is mentioned in chapter 2.2 DC electrical specifications. User must take into consideration surge current and current consumption issues before using these pins. Also, the user must be aware for any voltage drop on the feeding path.

4.9 UART pins

Pins 7, 8, 9, 10 are used for UART serial transmission between the module and the terminal. The UART signal level corresponds to the level in VCC_IO pin. VCC_IO pin must be fed with a correct voltage level to match the terminal device.

4.10 GPIO pins

See separate document: TIL-0026_SATEL-Radio-Modules_GPIO-Interface.pdf

Unused pins should be left unconnected.

5 MECHANICAL CONSIDERATIONS

5.1 Fixing device to host

The radio module can be mounted on to the host application by using spacers and screws. It is highly recommended to use conducting metal spacers and screws to create proper electrical conductivity between the module and the host application. Recommended materials for spacers include brass or aluminum and steel screws. User must take care that there is no excessive mechanical stress created to the DTE connector while inserting and attaching the module. Recommended maximum screw size is M3, minimum spacer height between the module and the host application is 3 mm.

Figure 5.1 Example of module attachment to application PCB.

5.2 <u>Heat transfer</u>

Since the module creates heat while operating, it must take into consideration to maximize the heat transfer from the module to an external heat sink. Proper heat sinking methods could be copper plated PCB, metal housing or a heat sink piece. The most recommended solution is to use a metal conductor to transfer heat from the module to an external heat sink which dimensions and location is adequate for a proper performance. To source the heat from the module is the plain area next to the antenna connector shown in a figure 5.2. Heat can be conducted from either side. To further improve the heat conductivity and reducing the heat transfer barriers, proper heat conducting paste or heat conducting tape should be used.

Figure 5.2 Heat sourcing area, both sides.

6 OPERATING MODES

MODE	FUNCTION	DESCRIPTION
Ready to receive	Search for sync	Module is searching for the start of a radio
from RF		transmission from the RF signal.
	Receive data	The module has found a valid radio transmission and
		is receiving data.
ТХ	Transmit	The module transmits
Safe mode		Mode is entered when a fault has been detected and
		the device has been Rebooted. In safe mode fault
		codes can be read from the module (section 6.1).
Sleep mode	Sleep1	Will turn the module into a state where it will hold
		parts of the radio on, wakeup time see section 2.3
Power Save	Power save	Automatic sleep/wake-up procedure where module
mode		sleeping time is dynamically adjusted to received data
		packets. Decreases the power consumption of
		complete receiving cycle approx. 30%.

The radio transceiver module has the following modes of operation:

6.1 Switching frequency band

SATEL-TR489 totally contains three different frequency Bands which are user selectable. Only one frequency band can be active at the time, which means that all user configurations are targeting at the selected band. Selection of active frequency band can be done with SATEL configuration manager or using SL commands.

When using SL commands, command mode usage is recommended. Sequence is as follows:

- Enter command mode (See section 7.2 SL Command Mode)
- Switch frequency band using SL Command
- Save Settings
- Reboot modem using SL Command or power cycle. Note that Command mode exit sequence is not required as after reboot device is in normal data mode.

SL commands are described in separate documentation. In order to get information of the latest and/or special SL commands please contact local SATEL distributor or SATEL: <u>https://www.satel.com/where-to-buy/</u>.

6.2 <u>Safe mode</u>

When a fault has been detected by the Firmware, the module is set to Safe mode. In this mode the module toggle's the STAT pin in 250 ms interval indicating an Error and reboots the device after 5 s. Transmitting/Receiving is prohibited during malfunction. When connecting to the device with SATEL Configuration Manager the Error code is shown in pop up box. If the device does not recover after multiple reboots, please contact SATEL Oy.

SATEL Configuration Manager can be downloaded from website <u>https://www.satel.com/support-and-services/downloads/</u>. The version 1.16.7 or newer is compatible with SATEL-TR489 radio transceiver module.

6.3 <u>Power up / power down scenarios</u>

The transceiver module can be set in four (4) states, "ON", "OFF", "Sleep1" and "Power Save". When power is applied to the module, the module switches to ON state when voltage in ENA_MOD is set to HIGH.

The module can be shut down by driving ENA_MOD line to LOW state. In the "OFF" state current consumption is only that of leakage current from an LDO, section 2.3. In this state all non-essential parts off the module are powered down and all settings/state information that are not stored in nonvolatile memory are reset.

6.4 <u>Sleep Mode</u>

When being in sleep mode, the radio part of the module is switched OFF while the serial interface communication related parts remain powered ON. The module will be automatically woken up after the CPU senses a state change in the TD1 pin. *Example:* The module is in Sleep1- mode. The module is woken up by sending a character or characters into the TD1 pin after which the module responses "**OK**". After "**OK**" the module is ready for normal communication.

To turn the module ON from Sleep1 mode:

- 1) Issue a state change to TD1 (toggle pin (minimum pulse duration time 10 μs) or issue a byte on the UART (for example 0x00))
- 2) Wait for "OK" -response from the module. The wake-up time is approx. 30 ms.
- 3) Start communicating normally

Module will remain powered ON until a new sleep command is issued.

6.5 <u>Power Save Mode</u>

The Power save mode performs an automatic, self-adjusting receiver wake-up/sleep cycle. It is designed for applications which base on one-way communication with relatively constant TX interval and, in which the data packet separation is > 200 ms.

When enabled, the unit makes the *transmission interval study* basing on four (4) successfully received data packets. The shortest time between transmitted packets is measured (t_{min}). Measured value is updated after each successfully received data packet, so that possible changes in the message length becomes noted.

Ensuring that the complete messages will be received even if there occur little variation in transmission interval, some safety margin (t_{marg}) is left into Ready to receive from RF mode time.

Safety margin is calculated by dividing the shortest time between transmitted packets (t_{min} , in ms) with 8 and by adding 60 ms to this result:

 $t_{marg} = \frac{t_{min}}{8} + 60 \text{ ms}$

The length of the whole sleeping period (t_{sleep}) is calculated by decreasing the shortest time between transmitted packets (t_{min}) with safety margin (t_{marg}) and transmission time of the original message (t_{TX}):

 $t_{sleep} = t_{min} - t_{marg} - t_{TX}$

Transmission interval study is started over always after 100 successful sleep/wake-up cycles and, if the expected receiving slot ($t_{RX \ slot}$) with enhanced overlap margin ($t_{overlap}$) has been missed. In latter case the package is considered to be lost.

 $t_{overlap} = t_{marg} + 100 ms$

 $t_{RX \ slot, \ min} = t_{min} - t_{marg}$ $t_{RX \ slot, \ max} = t_{min} + t_{overlap}$

Figure 6.1 Power save mode timing factors.

E.g. In system with TX interval of 1 s, and with 300 ms (approx. 300B @ 9600 bps) transmission time:

 $t_{min} = 1000 ms$ $t_{TX} = 300 ms$ $t_{marg} = 125 ms + 60 ms = 185 ms$

 t_{sleep} = 1000 ms - (125 ms + 60 ms) - 300 ms = 515 ms

 $t_{RX \, slot, \, min} = 1000 \, ms - 185 \, ms = 815 \, ms$ $t_{RX \, slot, \, max} = 1000 \, ms + 285 \, ms = 1285 \, ms$

6.6 <u>Restart</u>

After startup the module can be restarted by issuing a SL command, upon which the module will shut down all circuitry, and Reboot the CPU (see SL command list).

7 CHANGING PARAMETERS USING SL COMMANDS

The controlling terminal device can change the configuration settings of the module. This is accomplished with the help of SL commands. SL commands can be used to change e.g. the frequency or addresses. It is also possible to ask the radio transceiver module to show current settings which are in use.

The parameters changed to a device on frequency hopping 900 MHz band are taken into use after either radio reboot command, electrically restarting the device or exiting from the command mode (see SL Command Mode).

7.1 <u>SL Commands</u>

The controlling terminal device can change the configuration settings of a radio. This is accomplished with the help of SL commands, which can be used during data transfer. SL commands can be used to change e.g. the frequency or addresses. It is also possible to interrogate a radio modem in order to gain information concerning current settings that are in use. SL command -setting must be enabled before they can be used.

An SL command is a continuous string of characters, which is separated from other data by pauses which are equal or greater than time defined by Pause length parameter (default=3 characters) in the set-up. No extra characters are allowed at the end of an SL command. Serial interface settings are the same as in data transfer. SL command is properly recognized also in the case when the command string is terminated by <CR> (=ASCII character no. 13, Carriage Return, 0x0d) or <CR><LF> (<LF> = ASCII char. no. 10, Line Feed, 0x0a). If multiple SL commands are sent to the module, the next command can be given after receiving the response ("OK" or "ERROR") of the proceeding command. In addition, it is recommended to implement a timeout to the terminal software for recovering the case when no response is received from the radio module.

The transceiver module will acknowledge all commands by returning an "OK" (command carried out or accepted) or the requested value, or an "ERROR" (command not carried out or interpreted as erroneous) message.

It is possible to use SL commands in Port 2 (TD2 signal in GPIO3 (Pin13) and RD2 signal in GPIO1 (Pin11)) when Port2 Function has been configured as Diagnostics. SL commands can be used even in parallel with Port1 – in that case the response appears in the same port where the SL command came from.

Port2 is configured on Serial Interface sheet of SATEL Configuration Manager software by selecting the Port2 Function:

- OFF (=Port 2 not in use)
- Diagnostics (=SL commands ON in this case)

CR/LF characters are added to end the response messages (unless they are already present) in order to make parsing easier. Settings can be toggled, SL Commands ON/OFF, CR/LF ON/OFF. SL commands are described in separate documentation. In order to get information of the latest and/or special SL commands please contact local SATEL distributor or SATEL: <u>https://www.satel.com/where-to-buy/</u>.

7.2 <u>SL Commands Mode</u>

The SL commands have always been enabled in the previous products like M3-R3. When the SL commands are enabled there are possibilities that the user data may start with the characters "SL" which is handled as the SL command. This has caused the firmware to go to the continuous SL command search mode and any data has not been sent or even an "ERROR" acknowledgment has been received. To avoid this kind behavior the user can disable the SL commands.

The SL commands can be disabled or enabled by using SL commands or toggling the "*SL Command mode*" parameter via the *SATEL Configuration Manager*, version v1.16.7 or newer.

By default the *SL Command mode* is set to ON. If the *SL Command mode* is set to OFF then the SL commands can be enabled or disabled by using the below described procedure. Regardless of original SL command –setting state, changing the setting state with this procedure will effect to the reception process of the radio module. SL command –setting state can be changed only via SATEL Configuration Manager in maintenance access level.

Note1

To enable the SL Commands* (disables interface transmission and reception):

• Send three "+" characters via serial port so that there is at least three bytes delay between each character. The response is "OK", when successfully set.

<+><at least three bytes pause><+><at least three bytes pause><+>

To disable the SL Commands* (enables radio interface transmission and reception):

 Send three "-" characters via serial port so that there is at least three bytes delay between each character. The response is "OK", when successfully set.
 <-><at least three bytes pause><-><at least three bytes pause><->

*) Regardless of the set state for the SL command mode.

Note2

The "+ + +" and "- - -" procedures are not allowed to be used, when radio is transmitting or receiving data (i.e. the application data occupies the TD or RD lines of the radio).

Note 3

900MHz frequency band parameters set via SL commands require device restart for the new parameters to be taken into use. The device reset is performed during exiting the command mode (---).

9 CONSIDERATIONS

9.1 <u>EMI Interferers</u>

The module is designed to be mounted inside a host device. The module is designed to withstand EMI even beyond type approval requirements. However, a small module which is integrated closely to modern high-speed electronics is bound to receive some interference.

To make a working integration, consider the following: EMI can enter the module in four ways:

- 1) Via the antenna (radiation from enclosure enters the antenna)
- 2) Radiated disturbances to the coaxial cable
- 3) Radiation from other electronics / cabling directly to the module
- 4) Conducting through the DTE interface (power, control and data lines).

Because the module is shielded and the DTE interface is filtered, the usually worst method of disturbance is via the antenna port, which is easily overlooked in design. Keep in mind that the radio module has a sensitivity of approx. -115 dBm (depends on mode of operation and speed etc.). While the module has an approx. 10 dB S/N requirement, this constitutes, that any signal entering the radio antenna on receive frequency on a level of < -125 dBm (-115 dBm -10 dB), causes desensitization of the radio on that particular channel.

Example:

An interferer has a level of -100 dBm on the frequency 421 MHz. The radio will show an approximate sensitivity of -90 dB (-100 dBm+S/N requirement 10 dB) on 421 MHz.

Now consider that generic EMC requirements usually have pass/fail criteria of -57 dBm (if normalized to the surface of the device). So there is almost a 70 dB gap between generic EMC requirements and co-existence requirements between a high sensitivity narrowband radios.

To avoid problems of co-existence a good design should apply:

- 1) EMI shielding in enclosure ambient air interface
- 2) careful layout
- 3) shielding of all digital high-speed parts and cables
- 4) Have a clocking plan to avoid clock frequencies causing harmonics on the UHF band of interest.

Number one is to recognize this challenge and act upon it.

SATEL R&D can help in this by participating in design review of the host device, aiming to catch problems early in the design phase.

9.2 Electrostatic discharge

As the module is intended to be embedded in a host application, in a typical use case, the antenna port is the only port of the module directly interface with a surface or contact area subjected to Electrostatic Discharge (ESD). Thus, the antenna port is the only interface with high level ESD protection. The DTE port also features ESD protection diodes, but is not designed to withstand similar performance as expected from standalone units with enclosures.

Consequently, the module should be subject to ESD handling precautions that typically apply to ESD sensitive components. Proper ESD handling and packaging procedures must be applied throughout the processing, handling and operation of any application that incorporates this module.

9.3 Using the device in unmanned high reliability applications

The module features software and hardware watchdogs which are incorporated inside the CPU. While we believe that this is a reliable method of keeping the module in operational condition, there are parts of the module that can't be monitored for proper operation to 100%. For example the module chip has a firmware that resides in the chips RAM. The firmware can't be read back or reloaded, without interrupting reception. Hence the module can't reload this automatically by itself without causing breaks in communication. To avoid the module from ending up in a state where for example the module chip firmware is corrupted for example by ionizing radiation, it is recommended that the controlling system implements some form of watchdog function for the module. This can be done for example if the system knows that data should be received every second, and no data has been received for a minute – then do a module restart using the ENA_MOD pin or by issuing a restart command, or a cold boot by toggling VCC_IN low and high again.

9.4 **Proposals for more reliable radio link**

In case where the environment is challenging the following methods can be used for improving the transmission reliability:

- Forward Error Correction, FEC, is recommend to use in challenging environment like urban areas.
- Directional antennas.
- Before building the radio link(s) it is highly recommend that the radio environment is measured to find out whether the radio environment is clean enough by using a spectrum analyzer or radio module's RSSI, Received Signal Strength Indication, value.
- Co-operation with the local authority to find out the optimum free radio channel.
 - If the channel is disturbed an external band-pass filter can be used for improving the filtering.
 - If at the adjacent channel is TDMA, Time Domain Multiple Access, it is recommended to use time slot for receiving which is not in synchronization with the TDMA radio transmission.
 - In Europe it is not recommended to use channels which are located near by the TETRA or television frequencies.

10 APPENDIX

10.1 Sub-band Channel Assignment

Note! Supported only with 800 MHz band

Sub-band

Each sub-band is defined by a start and stop frequency. Furthermore, the maximum allowed power level and maximum duty cycle is defined separately for each sub-band.

Duty cycle

The purpose of the duty cycle limit is to ensure that no single application can occupy this licensefree band for more than a certain percentage of time. The term duty cycle defines the percentage of a 1-hour period a single modem is allowed to transmit. The modem limits the duty cycle itself.

Power level

The power level limit is defined separately for each sub-band. The maximum power limit for each sub-band is pre-programmed into the SATEL-TR489. The user can choose from 10, 20, 50, 100, 200 and 500 mW ERP* output power for frequency variant 856...876 MHz. No matter what power level the user has chosen the maximum allowed power level of the chosen sub-band cannot be exceeded.

*ERP = The effective radiated power from the antenna relative to a half-wave dipole in a certain direction

Channel assignment

Each sub-band is divided into 25 kHz channels according to a channel assignment scheme defined by the recommendation CEPT/ERC/REC 70-03.

10.2 Module dimensions

In figure below is SATEL-R4+ and SATEL-TR4+ with dimensions as millimeters.

10.3 <u>SL commands</u>

SL commands are described in separate documentation. In order to get information of the latest and/or special SL commands please contact local SATEL distributor or SATEL: <u>https://www.satel.com/where-to-buy/</u>.

11 VERSION HISTORY

Version:	Date:	Remarks:	
0.1	04.12.2020	First Draft	
0.1	17.12.2020	First Draft updated	
0.2	01.03.2021	RF-parameters updated	
0.3	03.03.2021	Value list updated	
0.4	03.03.2021	Added chapter 6.1 Switching frequency band	
0.5	05.03.2021	Added ANNEX: SL-command List	
0.6	12.11.2021	Added ANNEX: Sub-band Channel Assignment	
0.6	22.11.2021	Value list updated	
0.8	13.12.2021	Values and other updates	
0.9	28.12.2021	Values and other updates	
1.0	04.02.2022	Regulatory changes	
1.1	17.5.2022	SL command and SW information updates	
1.2	20.12.2022	GPIO document referrals corrected	
1.3	03.03.2023	Added information for chapter 7
